## 1 Trace Derivatives

- (a) Let **P** be a  $p \times q$  matrix and **Q** be a  $q \times p$  matrix. Compute  $\frac{\partial \text{trace}(\mathbf{PQ})}{\partial \mathbf{P}}$ .
- (b) Let **P** be a  $p \times q$  matrix and **Q** be a  $q \times q$  matrix. Compute  $\frac{\partial \operatorname{trace}(\mathbf{PQP}^{\top})}{\partial \mathbf{P}}$  at  $\mathbf{P} = \mathbf{U}$ .

## 2 Unitary invariance

- (a) Prove that the regular Euclidean norm (also called the  $\ell^2$ -norm) is unitary invariant; in other words, the  $\ell^2$ -norm of a vector is the same, regardless of how you apply a rigid linear transformation to the vector (i.e., rotate or reflect). Note that rigid linear transformation of a vector  $\mathbf{v} \in \mathbb{R}^d$  means multiplying by an orthogonal  $\mathbf{U} \in \mathbb{R}^{d \times d}$ .
- (b) Now show that the Frobenius norm of matrix  $\mathbf{A}$  is unitary invariant. The Frobenius norm is defined as  $\|\mathbf{A}\|_F = \sqrt{\sum_{i,j=1}^n |a_{ij}|^2} = \sqrt{tr(\mathbf{A}^\top \mathbf{A})}$ .
- 3 Least Squares (using vector calculus)
  - (a) In ordinary least-squares linear regression, we typically have n > d so that there is no w such that  $\mathbf{X}\mathbf{w} = \mathbf{y}$  (these are typically overdetermined systems too many equations given the number of unknowns). Hence, we need to find an approximate solution to this problem. The residual vector will be  $\mathbf{r} = \mathbf{X}\mathbf{w} \mathbf{y}$  and we want to make it as small as possible. The most common case is to measure the residual error with the standard Euclidean  $\ell^2$ -norm. So the problem becomes:

$$\min_{\mathbf{w}} \|\mathbf{X}\mathbf{w} - \mathbf{y}\|_2^2$$

Where  $\mathbf{X} \in \mathbf{R}^{n \times d}$ ,  $\mathbf{w} \in \mathbf{R}^d$ ,  $\mathbf{y} \in \mathbf{R}^n$ . Derive using vector calculus an expression for an optimal estimate for  $\mathbf{w}$  for this problem assuming  $\mathbf{X}$  is full rank.

- (b) How do we know that  $\mathbf{X}^{\top}\mathbf{X}$  is invertible?
- (c) What should we do if **X** is not full rank?
